

# CEMCAP

CEMCAP is a Horizon 2020 project with the objective to prepare the grounds for cost- and resource-effective CCS in European cement industry.

This project is funded by the European Union's Horizon 2020 Framework Programme for research and innovation

# Oxyfuel Burner Technology

## Objective

- Develop through demonstration tests and simulation analysis an optimized oxyfuel firing concept for a downscaled cement kiln burner.

## Conclusions

- Modern high momentum jet burners could be used for oxyfuel operation without modifications necessary (limitation in max. O<sub>2</sub> concentration apply). Flue gas recycle ratio, gas distribution in burner outlets and swirl adjustment are key parameters in order to obtain similar flame formation and heat transfer behavior as in air combustion.
- Incident radiant heat flux to furnace walls (and therefore, to material bed in a rotary kiln) is altered under CO<sub>2</sub>/O<sub>2</sub> oxidizing medium.
- An oxygen enrichment in primary gas of 60 vol.% favors full oxidation to CO<sub>2</sub> (dominance of heterogeneous gasification reaction  $C_{(s)} + CO_2 \rightarrow 2CO$  is mitigated).

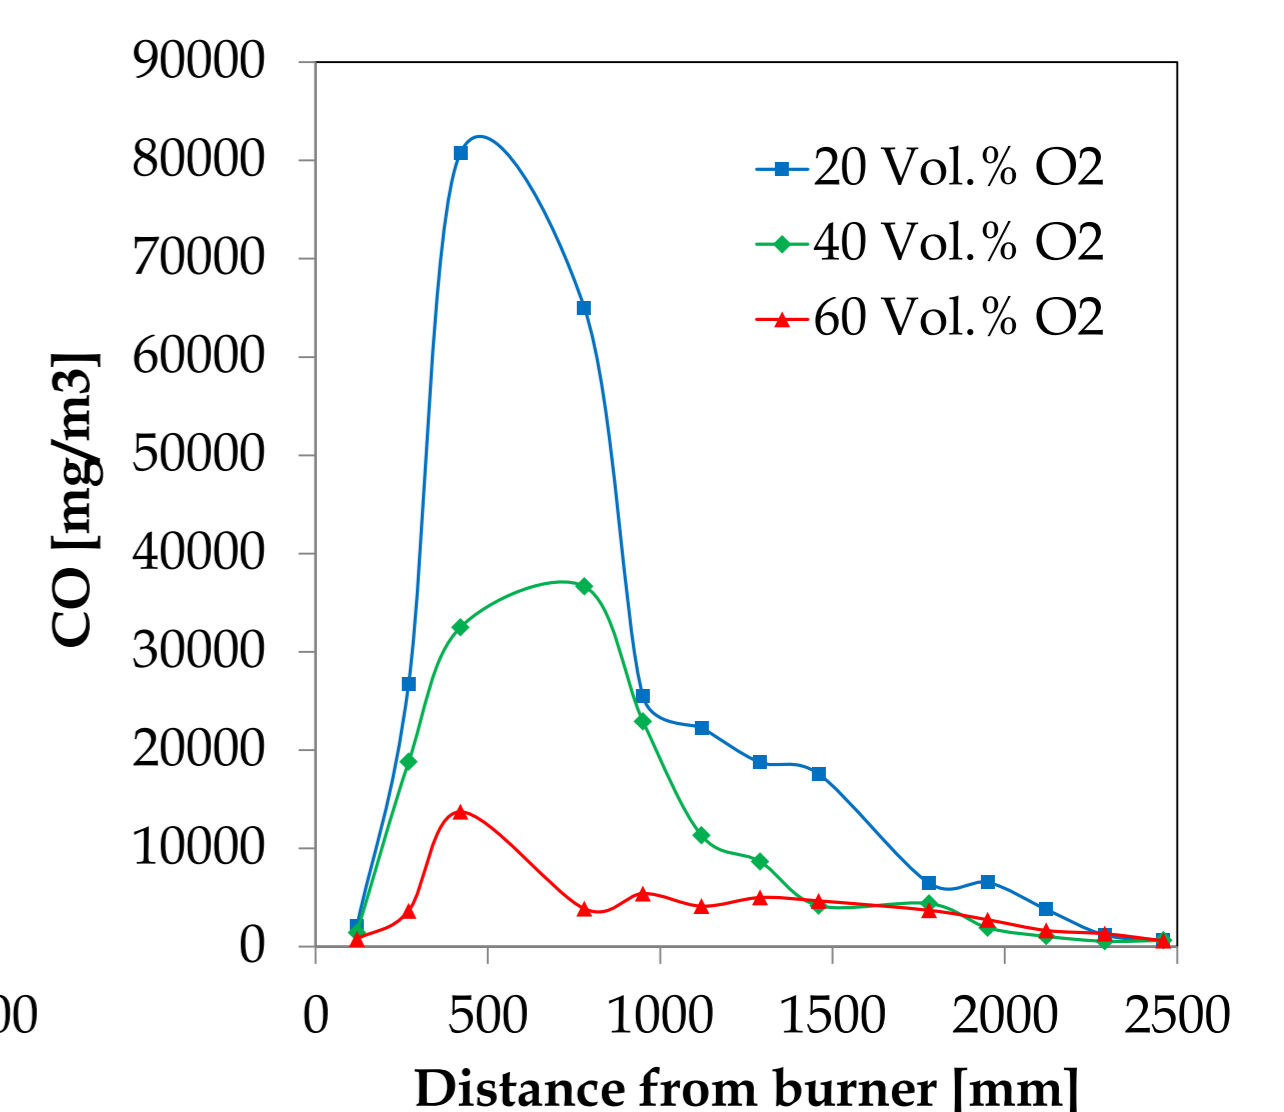

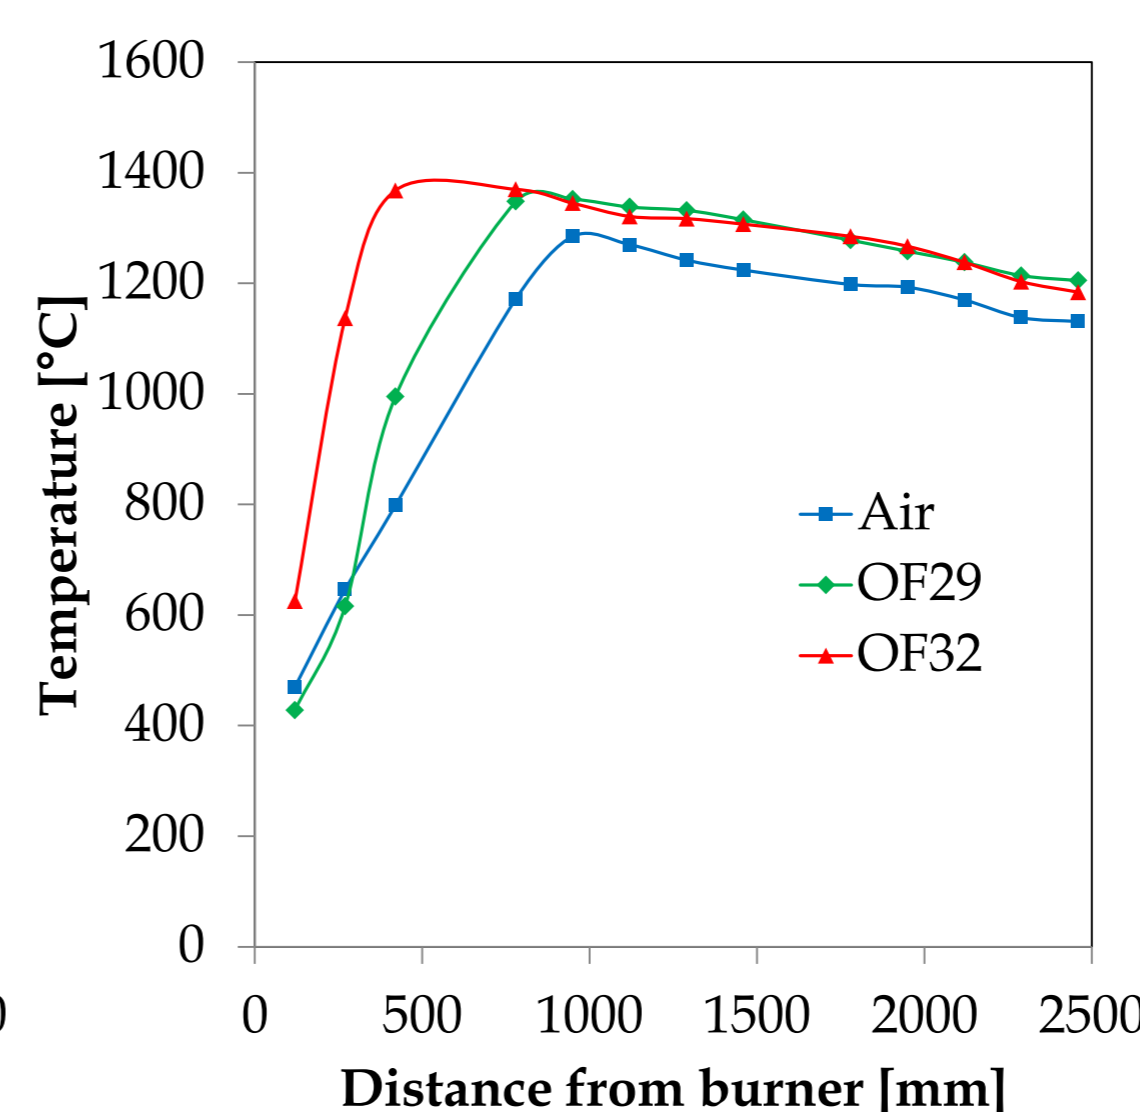

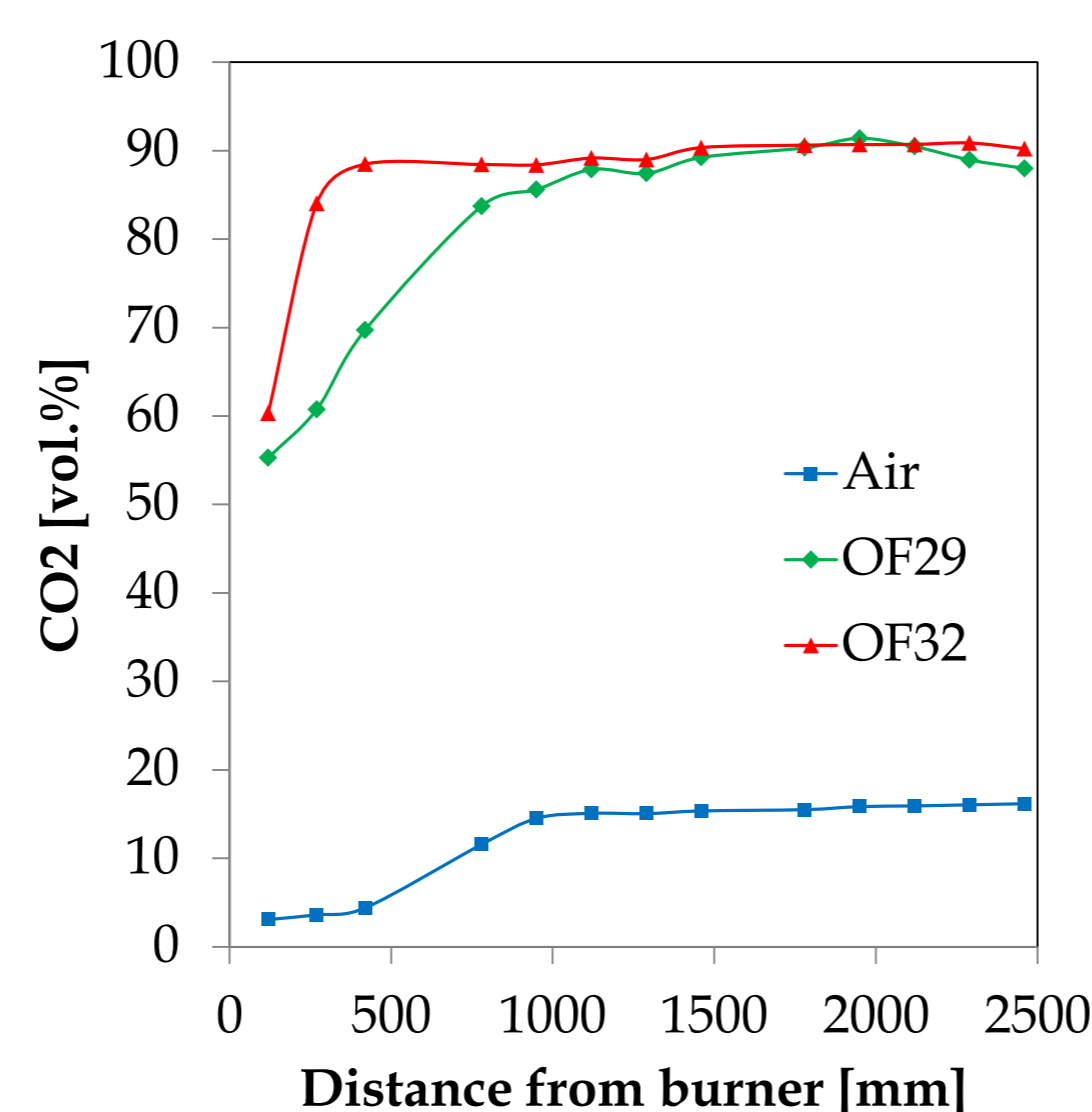

## Work Package 7 Research Activities

### Demonstration tests:

- Demonstration tests carried out in a modified 500 kW top-fired furnace at University of Stuttgart.
- Fuels used: pre-dried lignite and petcoke.
- Parameters varied: oxygen enrichment in total gas for combustion (27-32 vol.%), oxygen enrichment in primary gas (20-60 vol.%), and swirl angle (0°-40°).
- Comparative analysis of diverse oxyfuel settings vs. conventional air combustion in terms of: heat fluxes to the wall, gas temperature, species concentrations (O<sub>2</sub>, CO<sub>2</sub>, CO, NO<sub>x</sub> and SO<sub>2</sub>), and fuel burnout.

Burner tip of downscaled burner (design based on ThyssenKrupp's POLFLAME® burner).

### CFD Simulation analysis:

- Following the validation of CFD models using results from the demonstrations tests several CFD simulations have been performed for an upscaled oxyfuel burner.
- A set of input parameters (inlet flow rates, temperatures, compositions, swirl angle) for oxyfuel generates a flame in the kiln delivering a heat radiation profile to the material similar to that in the reference air case.
